1. The subject matter of claims 5 to 9 in the application is not novel (PCT Article 33(2)) in view of the optionally multilayer dosage forms in film form which are disclosed in documents D1 to D6 and comprise an active ingredient-containing layer composed of a polyacrylic acid derivative and of a polysaccharide such as, for example, hydroxypropyl(methyl)cellulose or hydroxyethylcellulose, with at least partial crosslinking between the polyacrylic acid derivative and the polysaccharide naturally taking place during the production thereof (see the passages of text mentioned in the search report). It should further be noted that a product does not become novel simply by being produced by a different process.

2. The subject matter of claims 1 to 4 is obvious (PCT Article 33(3)) from the routine use of previously disclosed devices (see D7, figure 4 and claim 10) in which a two-component nozzle allowing simultaneous spraying of different solutions of polymers and crosslinkers is used in the production of optionally multilayer dosage forms in film form by spraying, as disclosed in documents D2, D3 or D4. It should further be

noted that the only comparative test in the application uses just such a device, and thus the object of the application can only be to provide further good processes for producing dosage forms in film form. The application contains no evidence which might substantiate the achievement of a more demanding object (e.g. providing an improved process for producing a dosage form in film form) compared with the disclosed prior art.
